Review: Vanilla policy gradient (REINFORCE)

REINFORCE algorithm: Loop:

- 1. sample $\{\tau^i\}$ from $\pi_{\theta}(a_t|s_t)$ (run the policy)
- 2. $\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=0}^{T} \nabla_{\theta} \log \pi_{\theta}(a_t^i | s_t^i) \sum_{t'=t}^{T} \gamma^{t'-t} r(s_t^i, a_t^i)$
- 3. $\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$

Problems of vanilla policy gradient (REINFORCE)

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{i=1}^{N} \sum_{t=1}^{T} \nabla_{\theta} \log \pi_{\theta}(a_{t}^{i} | s_{t}^{i}) Q^{\pi}(s_{t}^{i}, a_{t}^{i})$$
$$\theta \leftarrow \theta + \alpha \nabla_{\theta} J(\theta)$$

- ullet Hard to select the step size lpha
 - Too big step: Bad policy → data collected under bad policy → we cannot recover (in Supervised Learning, data does not depend on neural network weights)
 - Too small step: Not efficient use of experience (in Supervised Learning, data can be trivially re-used)

Problems of vanilla policy gradient (REINFORCE)

 Small changes in the policy parameters can unexpectedly lead to big changes in the policy

Gradient descent in parameter space

 The step size in gradient descent results from solving the following optimization problem, e.g., using line search

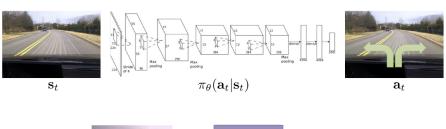

$$d^* = \arg\max_{\|d\| \le \epsilon} J(\theta + d)$$

- Euclidean distance in parameter space
- Stochastic gradient descent (SGD)

$$\theta \leftarrow \theta + d^*$$

Hard to pick the threshold ϵ

- It is hard to predict the result on the parameterized distribution
 - Especially for nonlinear function approximators, e.g., neural networks

Gradient descent in distribution space

Gradient descent in parameter space

$$d^* = \arg\max_{\|d\| \le \epsilon} J(\theta + d)$$

 Natural gradient descent: the step size in parameter space is determined by considering the KL divergence in the distributions before and after the update

$$d^* = \underset{d}{\operatorname{arg\,max}} J(\theta + d), \quad s.t. \, D_{\mathrm{KL}}(\pi_{\theta} || \pi_{\theta + d}) \le \epsilon$$

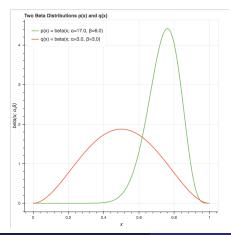

- KL divergence in distribution space
- Easier to pick the distance threshold!!!

Distance for probability distributions

• How to calculate the distance between two points in a 2D coordinate?

distance =
$$\sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$$

Euclidean distance

• How to calculate the distance between two **probability** distributions, p(x) and q(x)?

Kullback-Leibler (KL) divergence

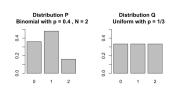

• A measure of how one probability distribution, p(x), is different from a second, reference probability distribution, q(x)

$$D_{KL}(p(x)||q(x)) = \sum_{i} p(x_i) \log \frac{p(x_i)}{q(x_i)}$$

$$D_{KL}(p(x)||q(x)) = \int_{x} p(x) \log \frac{p(x)}{q(x)} dx$$

• A KL divergence of 0 indicates that the two distributions are identical

KL divergence: An example

$$\begin{split} D_{\mathrm{KL}}(P \parallel Q) &= \sum_{x \in \mathcal{X}} P(x) \ln \left(\frac{P(x)}{Q(x)} \right) \\ &= 0.36 \ln \left(\frac{0.36}{0.333} \right) + 0.48 \ln \left(\frac{0.48}{0.333} \right) + 0.16 \ln \left(\frac{0.16}{0.333} \right) \\ &= 0.0852996 \\ D_{\mathrm{KL}}(Q \parallel P) &= \sum_{x \in \mathcal{X}} Q(x) \ln \left(\frac{Q(x)}{P(x)} \right) \\ &= 0.333 \ln \left(\frac{0.333}{0.36} \right) + 0.333 \ln \left(\frac{0.333}{0.48} \right) + 0.333 \ln \left(\frac{0.333}{0.16} \right) \\ &= 0.097455 \end{split}$$

KL divergence: A test

• Suppose two Gaussian distributions:

$$p(x) \sim \mathcal{N}(\mu_1, \sigma_1^2), \quad q(x) \sim \mathcal{N}(\mu_2, \sigma_2^2)$$

• What is $D_{KL}(p(x)||q(x))$?

$$\log \frac{\sigma_2}{\sigma_1} + \frac{\sigma_1^2 + (\mu_1 - \mu_2)^2}{2\sigma_2^2} - \frac{1}{2}$$

KL divergence between two Gaussians

$$p(x) \sim \mathcal{N}(\mu_1, \sigma_1^2), \quad \mathbb{E}_{p(x)}[x] = \mu_1, \quad var_{p(x)}[x] = \mathbb{E}[(x - \mu_1)^2] = \sigma_1^2$$

$$\begin{split} \mathbf{D}_{\mathrm{KL}}(p(x)||q(x)) &= \mathbb{E}_{p(x)}[\log p(x) - \log q(x)] \\ &= \mathbb{E}_{p(x)} \left[-\log(\sqrt{2\pi\sigma_1}) - \frac{(x-\mu_1)^2}{2\sigma_1^2} + \log(\sqrt{2\pi\sigma_2}) + \frac{(x-\mu_2)^2}{2\sigma_2^2} \right] \\ &= \log \frac{\sigma_2}{\sigma_1} - \frac{\mathbb{E}_{p(x)}[(x-\mu_1)^2]}{2\sigma_1^2} + \frac{\mathbb{E}_{p(x)}[(x-\mu_1+\mu_1-\mu_2)^2]}{2\sigma_2^2} \\ &= \log \frac{\sigma_2}{\sigma_1} - \frac{\sigma_1^2}{2\sigma_1^2} + \frac{\mathbb{E}_{p(x)}[(x-\mu_1)^2 + 2(x-\mu_1)(\mu_1-\mu_2) + (\mu_1-\mu_2)^2]}{2\sigma_2^2} \\ &= \log \frac{\sigma_2}{\sigma_1} + \frac{\sigma_1^2 + (\mu_1 - \mu_2)^2}{2\sigma_2^2} - \frac{1}{2} \end{split}$$

Table of Contents

- 3 Proximal policy optimization (PPO)

Back to natural gradient descent

• How to solve this constrained optimization problem?

$$d^* = \underset{d}{\operatorname{arg max}} J(\theta + d), \quad s.t. \, D_{\mathrm{KL}}(\pi_{\theta} || \pi_{\theta + d}) \le \epsilon$$

- What tool to use?
 - Turn the constrained optimization problem to an unconstrained one?

Lagrangian multiplier

• How to solve this constrained optimization problem?

$$d^* = \underset{d}{\operatorname{arg max}} J(\theta + d), \quad s.t. \, D_{\mathrm{KL}}(\pi_{\theta} || \pi_{\theta + d}) \le \epsilon$$

• Use the Lagrangian multiplier λ , turn to the unconstrained penalized objective

$$d^* = \arg\max_{d} J(\theta + d) - \lambda(\mathrm{D_{KL}}(\pi_{\theta}||\pi_{\theta+d}) - \epsilon)$$

Taylor expansion for the unconstrained penalized objective

$$d^* = \arg\max_{d} J(\theta + d) - \lambda(\underset{d}{\mathbf{D}_{\mathrm{KL}}}(\pi_{\theta}||\pi_{\theta+d}) - \epsilon)$$

First-order Taylor expansion for the loss

$$J(\theta + d) \approx J(\theta) + \nabla_{\theta'} J(\theta')|_{\theta' = \theta} \cdot d$$

• Second-order Taylor expansion for the KL

$$D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta+d}) \approx \frac{1}{2} d^T \cdot \nabla_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} \cdot d$$

Taylor series/expansion

 A representation of a function as an infinite sum of terms that are calculated from the values of the function's derivatives at a single point

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x - a)^n$$

= $f(a) + f'(a)(x - a) + \frac{f''(a)}{2} (x - a)^2 + \dots$

Examples

$$e^x = ?$$

$$\frac{1}{1-x} = ?$$

Taylor series/expansion

 A representation of a function as an infinite sum of terms that are calculated from the values of the function's derivatives at a single point

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$$

= $f(a) + f'(a)(x-a) + \frac{f''(a)}{2} (x-a)^2 + \dots$

Examples

$$e^{x} = 1 + x + \frac{x^{2}}{2!} + \frac{x^{3}}{3!} + \dots$$
$$\frac{1}{1 - x} = 1 + x + x^{2} + x^{3} + \dots$$

Taylor expansion of $J(\theta + d)$

- Let $\theta' = \theta + d$ is the independent variable
- That is, $x = \theta'$, $a = \theta$, x a = d
- What is the Taylor expansion of $J(\theta + d)$?

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$$

= $f(a) + f'(a)(x-a) + \frac{f''(a)}{2} (x-a)^2 + \dots$

Taylor expansion of $J(\theta + d)$

- Let $\theta' = \theta + d$ is the independent variable
- That is, $x = \theta'$, $a = \theta$, x a = d
- What is the Taylor expansion of $J(\theta + d)$?
- First-order Taylor expansion for the loss:

$$J(\theta + d) \approx J(\theta) + \nabla_{\theta'} J(\theta')|_{\theta' = \theta} \cdot d$$

- Let $\theta' = \theta + d$ is the independent variable
- That is, $x = \theta'$, $a = \theta$, x a = d
- What is the Taylor expansion of $D_{KL}(\pi_{\theta}||\pi_{\theta+d})$?

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$$

= $f(a) + f'(a)(x-a) + \frac{f''(a)}{2} (x-a)^2 + \dots$

- Let $\theta' = \theta + d$ is the independent variable
- That is, $x = \theta'$, $a = \theta$, x a = d
- What is the Taylor expansion of $D_{KL}(\pi_{\theta}||\pi_{\theta+d})$?
- Second-order Taylor expansion for $D_{KL}(\pi_{\theta}||\pi_{\theta'})$:

$$D_{KL}(\pi_{\theta}||\pi_{\theta'}) \approx D_{KL}(\pi_{\theta}||\pi_{\theta}) + d^{T}\nabla_{\theta'} D_{KL}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} + \frac{1}{2}d^{T}\nabla_{\theta'}^{2} D_{KL}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta}d$$

$$D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'}) \approx D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta}) + d^T \nabla_{\theta'} D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} + \frac{1}{2} d^T \nabla_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} d^T \nabla_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta'})|_{\theta'=\theta} d^T \nabla_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta'})|_{\theta'=\theta} d^T \nabla_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta'})|_{\theta'=\theta} d^T \nabla_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta'})|_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta'})|_{\theta'=\theta} d^T \nabla_{$$

$$\mathrm{D_{KL}}(\pi_{\theta}||\pi_{\theta'}) = \int \pi_{\theta}(x) \log \frac{\pi_{\theta}(x)}{\pi_{\theta'}(x)} \, \mathrm{d}x = \underbrace{\int \pi_{\theta}(x) \log \pi_{\theta}(x) \, \mathrm{d}x}_{\text{independent of } \theta'} - \int \pi_{\theta}(x) \log \pi_{\theta'}(x) \, \mathrm{d}x$$

$$\nabla_{\theta'} \operatorname{D}_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} = -\nabla_{\theta'} \int \pi_{\theta}(x) \log \pi_{\theta'}(x) \, \mathrm{d}x|_{\theta'=\theta}$$

$$= -\int \pi_{\theta}(x) \nabla_{\theta'} \log \pi_{\theta'}(x) \, \mathrm{d}x|_{\theta'=\theta}$$

$$= -\int \frac{\pi_{\theta}(x)}{\pi_{\theta'}(x)} \nabla_{\theta'} \pi_{\theta'}(x) \, \mathrm{d}x|_{\theta'=\theta}$$

$$= -\nabla_{\theta'} \int \pi_{\theta'}(x) \, \mathrm{d}x|_{\theta'=\theta}$$

$$= 0$$

$$D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'}) \approx D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta}) + d^T \nabla_{\theta'} D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} + \frac{1}{2} d^T \nabla_{\theta'}^2 D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} d$$

$$\nabla_{\theta'}^{2} \operatorname{D}_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta} = -\int \pi_{\theta}(x) \nabla_{\theta'}^{2} \log \pi_{\theta'}(x) \, \mathrm{d}x|_{\theta'=\theta}$$

$$= -\int \pi_{\theta}(x) \frac{\pi_{\theta'}(x) \nabla_{\theta'}^{2} \pi_{\theta'}(x) - \nabla_{\theta'} \pi_{\theta'}(x) \nabla_{\theta'} \pi_{\theta'}(x)^{T}}{\pi_{\theta'}(x)^{2}} \, \mathrm{d}x|_{\theta'=\theta}$$

$$= \underbrace{-\nabla_{\theta'}^{2} \int \pi_{\theta'}(x) dx|_{\theta'=\theta}}_{0} + \int \pi_{\theta}(x) \nabla_{\theta} \log \pi_{\theta'}(x) \nabla_{\theta} \log \pi_{\theta'}(x)^{T} \mathrm{d}x|_{\theta'=\theta}$$

$$= \mathbb{E}_{x \sim \pi_{\theta}} [\nabla_{\theta'} \log \pi_{\theta'}(x) \nabla_{\theta'} \log \pi_{\theta'}(x)^{T}|_{\theta'=\theta}]$$

Hessian of KL = Fisher information matrix (FIM)

 Hessian: A square matrix of second-order partial derivatives of a scalar-valued function, which describes the local curvature of a function of many variables

$$\boldsymbol{H} = \begin{bmatrix} \frac{\partial^2 f}{\partial x_1^2} & \frac{\partial^2 f}{\partial x_1 \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_1 \partial x_n} \\ \frac{\partial^2 f}{\partial x_2 \partial x_1} & \frac{\partial^2 f}{\partial x_2^2} & \cdots & \frac{\partial^2 f}{\partial x_2 \partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial^2 f}{\partial x_n \partial x_1} & \frac{\partial^2 f}{\partial x_n \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_n^2} \end{bmatrix}$$

ullet Fisher information: a way of measuring the amount of information that an observable random variable X carries about an unknown parameter θ upon which the probability of X depends

$$F(\theta) = \mathbb{E}_{x \sim \pi_{\theta}} [\nabla_{\theta} \log \pi_{\theta}(x) \nabla_{\theta} \log \pi_{\theta}(x)^{T}]$$

Hessian of KL = Fisher information matrix (FIM)

• The FIM is exactly the Hessian matrix of KL divergence

$$\underbrace{\nabla^2_{\theta'} \operatorname{D}_{\mathrm{KL}}(\pi_{\theta} || \pi_{\theta'})|_{\theta' = \theta}}_{\text{Hessian of KL}} = \underbrace{\mathbb{E}_{x \sim \pi_{\theta}} \left[\nabla_{\theta'} \log \pi_{\theta'}(x) \nabla_{\theta'} \log \pi_{\theta'}(x)^T |_{\theta' = \theta} \right]}_{\text{FIM}}$$

$$D_{KL}(\pi_{\theta}||\pi_{\theta'}) \approx \underbrace{D_{KL}(\pi_{\theta}||\pi_{\theta})}_{0} + d^{T} \underbrace{\nabla_{\theta'} D_{KL}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta}}_{0} + \frac{1}{2} d^{T} \underbrace{\nabla_{\theta'}^{2} D_{KL}(\pi_{\theta}||\pi_{\theta'})|_{\theta'=\theta}}_{\mathbf{F}(\theta)} d$$

$$= \frac{1}{2} d^{T} \mathbf{F}(\theta) d$$

$$= \frac{1}{2} (\theta' - \theta)^{T} \mathbf{F}(\theta) (\theta' - \theta)$$

Back to Taylor expansion of KL

$$D_{\mathrm{KL}}(\pi_{\theta}||\pi_{\theta} + d) \approx \frac{1}{2}d^{T}\boldsymbol{F}(\theta)d$$

- KL divergence is roughly analogous to a distance measure between distributions
- Fisher information serves as a local distance metric between distributions: how much you change the distribution if you move the parameters a little bit in a given direction

Back to solving the KL constrained problem

$$d^* = \underset{d}{\operatorname{arg max}} J(\theta + d) - \lambda (D_{KL}(\pi_{\theta} || \pi_{\theta + d}) - \epsilon)$$

$$\approx \underset{d}{\operatorname{arg max}} J(\theta) + \nabla_{\theta'} J(\theta')|_{\theta' = \theta} \cdot d - \lambda (\frac{1}{2} d^T \nabla_{\theta'}^2 D_{KL}(\pi_{\theta} || \pi_{\theta'})|_{\theta' = \theta} d - \epsilon)$$

$$= \underset{d}{\operatorname{arg max}} \nabla_{\theta'} J(\theta')|_{\theta' = \theta} \cdot d - \frac{1}{2} \lambda d^T \mathbf{F}(\theta) d$$

Set the gradient to 0:

$$0 = \frac{\partial}{\partial d} \left(\nabla_{\theta'} J(\theta')|_{\theta'=\theta} \cdot d - \frac{1}{2} \lambda d^T \mathbf{F}(\theta) d \right)$$
$$= \nabla_{\theta'} J(\theta')|_{\theta'=\theta} - \lambda \mathbf{F}(\theta) d$$

$$d^* = \frac{1}{\lambda} \mathbf{F}^{-1}(\theta) \nabla_{\theta'} J(\theta')|_{\theta' = \theta} = \frac{1}{\lambda} \mathbf{F}^{-1}(\theta) \nabla_{\theta} J(\theta)$$

Table of Contents

- Natural policy gradient
 - Policy gradient in distribution space
 - Solve the constrained optimization problem
 - Natural gradient
- 2 Trust region policy optimization (TRPO)
- 3 Proximal policy optimization (PPO)

Natural gradient descent

The natural gradient:

$$\widetilde{\nabla}_{\theta} J(\theta) = \mathbf{F}^{-1}(\theta) \underbrace{\nabla_{\theta} J(\theta)}_{\widehat{q}}$$

• Natural gradient ascent:

$$\theta' = \theta + \alpha \cdot \mathbf{F}^{-1}(\theta)\hat{g}$$

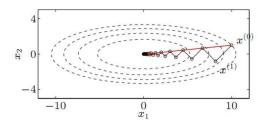

• How to determine the learning rate α :

$$D_{KL}(\pi_{\theta}||\pi_{\theta} + d) \approx \frac{1}{2}(\theta' - \theta)^{T} \mathbf{F}(\theta)(\theta' - \theta) \leq \epsilon$$
$$\frac{1}{2}(\alpha \hat{g})^{T} \mathbf{F}(\alpha \hat{g}) = \epsilon$$
$$\alpha = \sqrt{\frac{2\epsilon}{\hat{g}^{T} \mathbf{F} \hat{g}}}$$

Geometric interpretation of natural policy gradient

• Find the steepest direction for parameter updating

Essentially the same problem as this:

Natural gradient descent → Natural policy gradient (NPG)

Algorithm 1 Natural Policy Gradient

Input: initial policy parameters θ_0

for k = 0, 1, 2, ... do

Collect set of trajectories \mathcal{D}_k on policy $\pi_k = \pi(\theta_k)$

Estimate advantages $\hat{A}^{\pi_k}_t$ using any advantage estimation algorithm

Form sample estimates for

- policy gradient \hat{g}_k (using advantage estimates)
- ullet and KL-divergence Hessian / Fisher Information Matrix \hat{H}_k

Compute Natural Policy Gradient update:

$$heta_{k+1} = heta_k + \sqrt{rac{2\,oldsymbol{\mathcal{E}}}{\hat{oldsymbol{g}}_k^T\hat{oldsymbol{H}}_k}}\hat{oldsymbol{eta}_k^{-1}\hat{oldsymbol{g}}_k$$

end for

- Originated from natural gradient descent in supervised learning
- Very expensive to compute the inverse of Hessian matrix for a large number of parameters

Review of natural policy gradient

- The gradient
 - Constrain parameter update in parameter space (using Euclidean distance)
- The natural gradient
 - Constrain parameter update in distribution space (using KL divergence)
 - The meaning of "natural": the distance metric is invariant to function parameterization
- Fisher information matrix (FIM)
 - Second-order information: a local distance metric between distributions
 - The FIM is exactly the Hessian matrix of KL divergence
 - Expensive to compute for a large number of parameters

John Schulman's Homepage

I'm a research scientist at OpenAl. I co-lead the reinforcement learning (RL) team, where we work on (1) designing better RL algorithms that enable agents to learn much faster in novel situations; (2) designing better training environments that teach agents transferrable skills. We mostly use games as a testbed.

Previously, I received my PhD in Computer Science from UC Berkeley, where I had the good fortune of being advised by Pleter Abbeel. Prior to my recent work in RL, I spent some time working on robotics, enabling robots to tie knots and stitches and plan movement using trajectory optimization.

TRPO - The KL constrained problem

• The objective function:

$$\begin{split} & \underset{\theta}{\text{maximize}} \quad \hat{\mathbb{E}}_t \left[\frac{\pi_{\theta}(a_t|s_t)}{\pi_{\theta_{old}}(a_t|s_t)} \hat{A}_t \right] \\ & \text{subject to} \quad \hat{\mathbb{E}}_t \left[\mathrm{D_{KL}}[\pi_{\theta_{old}}(\cdot|s_t), \pi_{\theta}(\cdot|s_t)] \right] \leq \delta \end{split}$$

Also worth considering using a penalty instead of a constraint:

$$\underset{\theta}{\text{maximize}} \quad \hat{\mathbb{E}}_t \left[\frac{\pi_{\theta}(a_t|s_t)}{\pi_{\theta_{old}}(a_t|s_t)} \hat{A}_t \right] - \beta \hat{\mathbb{E}}_t \left[D_{\text{KL}} \left[\pi_{\theta_{old}}(\cdot|s_t), \pi_{\theta}(\cdot|s_t) \right] \right]$$

• Again the KL penalized problem!

TRPO = NPG + Line search + Monotonic improvement theorem

Algorithm 3 Trust Region Policy Optimization

Input: initial policy parameters θ_0

for
$$k = 0, 1, 2, ...$$
 do

Collect set of trajectories \mathcal{D}_k on policy $\pi_k = \pi(\theta_k)$

Estimate advantages $\hat{A}^{\pi_k}_t$ using any advantage estimation algorithm Form sample estimates for

- policy gradient \hat{g}_k (using advantage estimates)
- and KL-divergence Hessian-vector product function $f(v) = \hat{H}_k v$

Use CG with n_{cg} iterations to obtain $x_k pprox \hat{H}_k^{-1} \hat{g}_k$

Estimate proposed step $\Delta_k pprox \sqrt{rac{2\delta}{x_k^T \hat{H}_k x_k}} x_k$

Perform backtracking line search with exponential decay to obtain final update

$$\theta_{k+1} = \theta_k + \alpha^j \Delta_k$$

end for

Line search with monotonic policy improvement

Algorithm 2 Line Search for TRPO

```
Compute proposed policy step \Delta_k = \sqrt{\frac{2\delta}{\hat{g}_k^T \hat{H}_k^{-1} \hat{g}_k}} \hat{H}_k^{-1} \hat{g}_k for j = 0, 1, 2, ..., L do  \text{Compute proposed update } \theta = \theta_k + \alpha^j \Delta_k  if \mathcal{L}_{\theta_k}(\theta) \geq 0 and \bar{D}_{\mathit{KL}}(\theta||\theta_k) \leq \delta then accept the update and set \theta_{k+1} = \theta_k + \alpha^j \Delta_k break end if end for
```

• Still very **expensive** to compute the **inverse of Hessian matrix** for a large number of parameters

Table of Contents

- Natural policy gradient
 - Policy gradient in distribution space
 - Solve the constrained optimization problem
 - Natural gradient
- 2 Trust region policy optimization (TRPO)
- 3 Proximal policy optimization (PPO)

Proximal policy optimization (PPO): Clipped objective

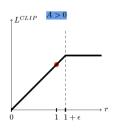

• The surrogate objective function:

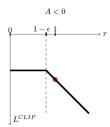

$$\mathcal{L}^{\mathsf{IS}}(\theta) = \hat{\mathbb{E}}_t \left[\frac{\pi_{\theta}(a_t | s_t)}{\pi_{\theta_{old}}(a_t | s_t)} \hat{A}_t \right] = \hat{\mathbb{E}}_t[r_t(\theta) \hat{A}_t]$$

Form a lower bound via clipped importance ratios

$$\mathcal{L}^{\mathsf{CLIP}}(\theta) = \hat{\mathbb{E}}_t \left[\min \left(r_t(\theta) \hat{A}_t, \mathsf{clip}(r_t(\theta), 1 - \epsilon, 1 + \epsilon) \hat{A}_t \right) \right]$$

- Prevent large changes of policies, constrain the policy update
- Achieve similar performance to TRPO without second-order information (no Fisher matrix!)

Proximal policy optimization (PPO): Adaptive KL penalty

```
Input: initial policy parameters \theta_0, initial KL penalty \beta_0, target KL-divergence \delta
for k = 0, 1, 2, ... do
   Collect set of partial trajectories \mathcal{D}_k on policy \pi_k = \pi(\theta_k)
   Estimate advantages \hat{A}_{t}^{\pi_{k}} using any advantage estimation algorithm
   Compute policy update
                                  \theta_{k+1} = \arg\max_{\theta} \mathcal{L}_{\theta_k}(\theta) - \beta_k \bar{D}_{KL}(\theta||\theta_k)
   by taking K steps of minibatch SGD (via Adam)
   if \bar{D}_{KL}(\theta_{k+1}||\theta_k) > 1.5\delta then
      \beta_{k+1} = 2\beta_k
   else if \bar{D}_{KL}(\theta_{k+1}||\theta_k) < \delta/1.5 then
      \beta_{k+1} = \beta_k/2
                                                Don't use second order approximation for KI which is
   end if
                                                expensive, use standard gradient descent
end for
```

- ullet Penalty coefficient eta changes between iterations to approximately enforce KL-divergence constraint
- Achieve similar performance to TRPO without second-order information (no Fisher matrix!)

Review

- TRPO: again the KL penalty problem
 - Natural policy gradient + Monotonic policy improvement + Line search
 - Still need to compute the natural gradient with Hessian matrix
- PPO
 - Achieve TRPO-like performance without second-order computation
 - Clipped objective, adaptive KL penalty

$$\begin{split} & \underset{\theta}{\text{maximize}} \quad \hat{\mathbb{E}}_t \left[\frac{\pi_{\theta}(a_t|s_t)}{\pi_{\theta_{old}}(a_t|s_t)} \hat{A}_t \right] \\ & \text{subject to} \quad \hat{\mathbb{E}}_t \left[\mathrm{D_{KL}}[\pi_{\theta_{old}}(\cdot|s_t), \pi_{\theta}(\cdot|s_t)] \right] \leq \delta \end{split}$$

Learning objectives of this lecture

- You should be able to...
 - Know how to derive the natural policy gradient
 - Be aware of several advanced algorithms, e.g., TRPO, PPO
 - Enhance your mathematical skills

Homework 3

- Study the policy gradient algorithm in detail
- ullet Implement the series of policy gradient algorithms on problems 1 & 2
 - Problem 1: the point maze navigation, continuous state-action space $(s, a \in \mathbb{R}^2, s \in [-0.5, 0.5]^2, a \in [-0.1, 0.1]^2)$
 - Problem 2: the MuJoCo HalfCheetah, make the robot run forward
 - Must use vanilla policy gradient and natural policy gradient, encourage to use TRPO and PPO
- Write a report introducing the algorithms and your experimentation
 - Explanations, steps, evaluation results, visualizations...
 - Submit the code and the report to mg20150005@smail.nju.edu.cn

THE END
